

Northern Pacific seastar

Asteriidae - Asterias amurensis

What does it look like?

The Northern Pacific seastar has five arms, which have pointed, and often up-turned tips. The arms join onto a central disc and are covered by clumps of small chisel-like spines. Reaches up to 50cm across. Yellow and/or purple to red. The arms are covered with numerous unevenly arranged small spines with jagged ends. There is also a single line of spines either side of the groove where its tube feet lie.

Why is it a problem?

If this seastar arrives in New Zealand it could have a serious impact on our aquaculture industry and our marine environment generally. The Northern Pacific Seastar is currently found in huge numbers in two areas of Australia (Derwent Estuary in Tasmania and Port Phillip Bay, Melbourne).

It feeds on wild and farmed shellfish and a wide variety of other marine animals. It is normally found in shallow water but can be found from the intertidal area through to the subtidal as deep as 200 m. It can be found on muddy, sandy, pebbly seabeds as well as on rocks and man-made surfaces, even mussel lines. You would not normally see it in areas with high wave action.

Control Methods

You must notify the Hawke's Bay Regional Council or the Ministry for Primary Industries if you suspect the presence of this organism

You can help prevent the spread of marine pests by:

- Regularly cleaning your boat's hull – ideally keep fouling growth to no more than a light slime layer.
- Applying a thorough coating of antifouling paint and keep it in good condition.
- Ensure your hull is clean and free of fouling before you travel to a new area.
- Clean and dry any marine equipment (e.g. ropes, lines and pots) before using in a new area.
- Inspect areas on your boat that retain water for signs of marine life.
- Check for aquatic weeds tangled around anchors, trailers and other equipment.

Notify Council

Northern Pacific seastar is not known to be present in New Zealand. If you have seen or suspect the presence of Northern Pacific seastar you must report the sighting to Hawke's Bay Regional Council immediately

Pest Management Programme

- Unwanted Organism

Summary of Rules

- The operator of a vessel entering the waters of the Hawke's Bay Regional Council must ensure the hull (includes hull area, niche areas and wind and water line) or any structure or navigation aid of any origin, insufficiently cleaned and antifouled so that there is no more than a slime layer and/or goose barnacles.

What is council doing about this?

Hawke's Bay Regional Council is working with other Councils and the Ministry of Primary Industries to detect if Northern Pacific seastar is introduced into Hawke's Bay
